

BUILDING EFFICIENCY

OMEGA provides turn-key building energy optimization services to suit your construction and location. We can reduce your annual utility costs by 20% to 80% by helping you to reduce your wasted energy and by drawing on proven renewable energy technology.

We offer:

- **Building energy conservation** - Most buildings were not designed for lowest energy consumption. The place to start is to optimize the energy you need for your building by making some low cost improvements. The **OMEGA Energy Survey** will uncover a list of changes you can make that will immediately reduce your heating and lighting costs.
- **Renewable energy generation on site** - The next step is to take advantage of your site's natural energy generating capacity from the sun and wind. **The OMEGA Energy Feasibility Study** will provide the most cost effective alternative energy project for your site. A number of alternatives are evaluated to help you make the right choice for your location.

Solar energy is already widely used for domestic hot water loads. There are also many buildings using solar heat collectors to supplement winter heating. Solar electric generation should also be considered to offset the cost of electricity from the power company.

Wind electric generators may be applicable in your region to offset the cost of electricity from the power company.

State grants and tax incentives are there to help you move in this direction. Energy costs will only increase over time so it makes sense to invest in the future by looking into ways to become less dependent on energy from the utility company.

- **Construction services** - OMEGA can provide assistance at every stage of the journey towards energy efficiency. When an energy efficiency project is approved, OMEGA can provide project management or turnkey construction services to make sure best resources are used and planned results are achieved.
- **Follow up services** - OMEGA provides on-site services to ensure the long term success of your project. Our experienced technicians monitor equipment condition, provide advice on maintenance, and test the system to ensure the highest return on your investment.
